

# FileWire Client

Secure file encryption and transfer software for end-users.

Make it easy for your customers to use file transfer software and encryption technology. Worldgroup Filewire allows you to distribute a branded software executable to your customers for their use in connecting to your file transfer server. Features include a one-click "send files" option, scripting support, and the ability to encrypt files with your key before transfer.

Your customers are going to need some software tool to be able to send you electronic files. Rather than forcing them to struggle with hard-to-use windows utilities like Hyper-Terminal, or purchase software products such as Procomm™, you can reduce your tech support and increase customer satisfaction by providing them a simple, easy-to-understand file transfer tool that not only sends file with a click, but encrypts them before they are sent!

**Encryption closes security gaps.** While typical web-based SSL transfer secures a file during transmission, it does not secure it after it has been delivered. Encrypting a file directly prevents viewing by a malicious, or an unintended recipient. FileWire provides support for digital signatures and encryption and meets government established requirements for electronic authentication and encryption by applying strong encryption (DES, RC2, RC4, and 3DES) and digital signatures.

**Data compression reduces storage and network costs.** Using industry standard ZIP compression provides reductions of up to 90 percent.

**Branding builds customer loyalty.** The FileWire client you distribute will be branded to your identity and connect only to your server. Not only will your customers appreciate software that easily links them to you, they will be less likely to use other services. FileWire lets you capture customers.

**Scripting support make automation easy.** Your Filewire client comes with your own prepackage scripts, allowing you to provide access to *any* back-office file server (ours, yours, or even our competitors!)

**Dial-up and Internet access provide flexibility.** Not everyone has the Internet, and sometimes the Internet is down for those that do. By having the ability to send files both via modem and over the Internet, you provide your customers flexibility and contingency options.

#### Includes:

- **Military-grade encryption**
- **Scripting Support**
- **Dial-up Access**
- **Internet Access**
- **Branding**
- **Data Compression**

# Technical Information

## General/User Interface Features

- In-Box / Out-Box motif
- Accessible through the web, FTP, Telnet, Dial-up modem
- Distributable client software for Windows
- Year 2000 Compliant

## Performance and Architecture

- Communications architecture supports COM1/2/3/4
- Connectivity methods: TCP/IP, Modem
- Upload/download protocols: XMODEM-CHECKSUM, XMODEM-CRC, XMODEM-1K, YMODEM-G, YMODEM-BATCH, ZMODEM, KERMIT, COMPUSERVE, ASCII

## System Requirements

- IBM PC or 100% compatible computer
- Windows 95, 98, NT 4.0, XP, or Windows 2000 software
- 8 MB RAM for Windows 95 (16 MB recommended)
- 16 MB RAM for Windows 98/NT 4.0 (32 MB recommended)
- 32 MB RAM for Windows 2000 (64 MB recommended)
- 2 MB of available hard disk space
- Minimum 256-color VGA video

## User Preferences

- User id and Password. Up to 30 characters
- IP address or URL of web/FTP server
- Dial-up primary/secondary phone numbers

## Security

- Uses PKZIP 5.0 file level security
- Password and certificate-based access for encryption using DES, RC2, RC4 and 3DES.

## Security

- Uses PKZIP 5.0 file level security
- Password and certificate-based access for encryption using DES, RC2, RC4 and 3DES

## Compression

- Uses PKZIP 5.0 file level compression

## Scripting capabilities

- Script command Support:
  - LABEL
  - CAPTURE / CLOSE CAPTURE
  - DIAL
  - DOWNLOAD
  - END
  - HANGUP
  - INPUT
  - ON\_TIMEOUT\_GOTO
  - PAUSE
  - PORT
  - PROTOCOL
  - SEND
  - SETTINGS
  - STOP
  - TIMEOUT
  - UPLOAD
  - WAITFOR

## Value Proposition: Healthcare
